

Experiment 4: Task Analysis and User Flow Design for Online Shopping Application

Name: Loga Prabha GB

Roll No: 240701290

Aim

To conduct task analysis for an online shopping application, document user flows, and create corresponding wireframes for improving user interaction and usability.

Objective

- To analyze user tasks in an online shopping application.
- To identify the sequence of user interactions.
- To design user flow diagrams for shopping activities.
- To create wireframes representing application screens.
- To improve usability and navigation in mobile applications.

Problem Statement

Users of online shopping applications perform multiple tasks such as browsing products, searching items, adding products to the cart, and placing orders. Poor navigation and unclear workflows can affect user experience. This experiment focuses on analyzing user tasks and designing effective user flows and wireframes to improve usability.

Task Analysis

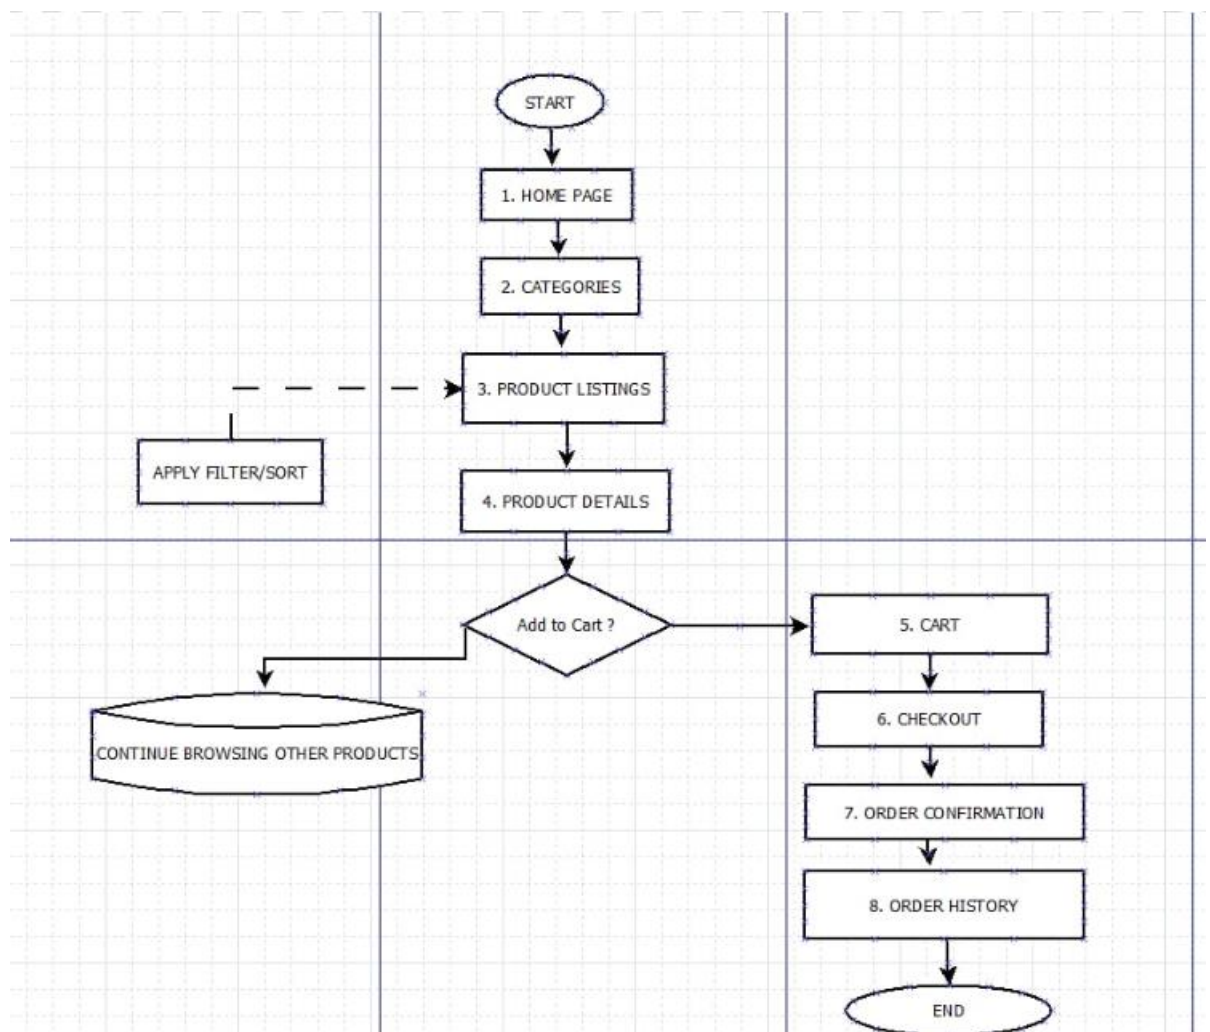

Task analysis identifies the sequence of actions users perform while using the online shopping application.

Main User Tasks

1. Open the application
2. Browse or search products
3. View product details
4. Add products to cart

5. Review cart
6. Checkout process
7. Enter shipping information
8. Enter payment details
9. Confirm and place order

User Flow Description

Step 1 – Open App

User launches the shopping application.

Step 2 – Home Screen

The home screen displays categories, offers, and search options.

Step 3 – Browse or Search

Users can:

- Browse product categories
OR
- Search products using keywords

Step 4 – Product Details

Selected products display:

- Product image
- Description
- Price
- Ratings

Step 5 – Add to Cart

Users add required items to the shopping cart.

Step 6 – Review Cart

Users verify selected products and quantity.

Step 7 – Checkout

Users proceed to checkout for order confirmation.

Step 8 – Shipping Information

Users enter delivery address and contact details.

Step 9 – Payment Information

Users choose payment methods and enter payment details.

Step 10 – Place Order

The order is successfully confirmed.

Result

The task analysis and user flow design successfully identified the important user interactions in the online shopping application. The wireframes provided a clear structure for navigation and improved usability.
